

Swarmplot:

```
#Swarm Plot
import seaborn as sns
import matplotlib.pyplot as plt
data=dataset
sns.swarmplot(x="degree_t",y="degree_p",data=data,hue="gender")
plt.show()
```

A swarm plot is a categorical scatter plot where individual data points are plotted. Points are automatically shifted along the categorical axis to prevent overlap, revealing the underlying distribution and density of your data without hiding any information.

Importance:

1. No overlapping of data points.
2. Distribution shape shows where data is highly concentrated.
3. The number of data points under each category is clearly visible compared to other methods.
4. Swarm Plot is well suited for small to medium data size as it is effective to look at individual data points.
5. This method clearly shows the visualization of numerical variable across different categories.
6. Swarm plot is highly effective when it's paired with box plot or violin plot.

```
#swarmplot overlaying boxplot
import seaborn as sns
import matplotlib.pyplot as plt
data=dataset
sns.boxplot(x="degree_t",y="degree_p",data=data,hue="gender")
sns.swarmplot(x="degree_t",y="degree_p",data=data,hue="gender")
plt.show()
```
